

## **PRACTICAL 5 : Temperature on LCD**

**Aim** : To interface a 16x2 LCD with Arduino and display temperature readings.

### **Overview** :

In this project, a temperature sensor is interfaced with an Arduino and a 16x2 LCD to display real-time temperature readings. This practical helps in learning about LCD interfacing, data communication between components, and the importance of real-time monitoring in IoT systems.

### **Materials Required** :

- Arduino Uno R3
- 1 x 220  $\Omega$  Resistor
- LCD 16x2
- Temperature Sensor (TMP36)
- Jumper Wires
- Arduino IDE (Installed on your Computer)

### **Circuit Connection and Steps** :

- 1. Connect the TMP36 Temperature Sensor :**
  - VCC  $\rightarrow$  5V, GND  $\rightarrow$  GND, VOUT  $\rightarrow$  A5 (Arduino).
- 2. Connect the 16x2 LCD Display :**
  - RS  $\rightarrow$  D7, E  $\rightarrow$  D8, D4-D7  $\rightarrow$  D9-D12 (Arduino).
  - VSS, RW, K  $\rightarrow$  GND, VDD, A  $\rightarrow$  5V.
  - V0  $\rightarrow$  Potentiometer (Middle Pin) for contrast control.
- 3. Connect the Potentiometer:**
  - One side  $\rightarrow$  5V, Other side  $\rightarrow$  GND, Middle  $\rightarrow$  V0 (LCD).
- 4. Power Connections:**
  - 5V  $\rightarrow$  Positive Rail, GND  $\rightarrow$  Negative Rail on Breadboard.

### **Circuit Diagram** :

The circuit diagram illustrates the connection between three components: U1 (Arduino UNO), U2 (LCD 16x2), and U3 (voltage divider). The LCD (U2) is connected to the Arduino (U1) via its I/O pins. The voltage divider (U3) provides a 3.3V reference voltage (AREF) to the Arduino. The power supply is connected to the top and bottom rails, labeled U1\_5V and U1\_GND respectively. A resistor R1 (220 ohms) is connected between the 5V supply and the LCD's VCC pin.

```
#include<LiquidCrystal.h>
const int rs = 12, en = 11, d4 = 5, d5 = 4, d6 = 3, d7 = 2;
LiquidCrystal lcd(rs, en, d4, d5, d6, d7);
float celsius;
int temp = A1;
void setup(){
    pinMode(temp,INPUT);
}
void loop(){
    celsius = analogRead(temp)*0.004882814;
    celsius = (celsius - 0.5) * 100.0;
    lcd.setCursor(0,1);
    lcd.print("→ Temp : ");
    lcd.print(celsius);
    lcd.print(" C");
    delay(1000);
    lcd.clear();
}
```

This project successfully demonstrates how to interface a 16x2 LCD with an Arduino to display real-time temperature readings. It reinforces the concepts of sensor integration and data visualization, providing a crucial step toward developing more complex IoT applications involving real-time monitoring systems.
